

Near-eye expected one-hour melEDI by site and light source

Dashed line: site-standardized category mean; filled points: BH-adjusted site deviation p < 0.05; open points: label not passed

Estimates use the selected seven-category interaction model; bars are participant-cluster-robust 95% confidence intervals. The dashed line is the geometric mean of model cell expectations with each site contributing equally on the fitted log scale. Filled points differ from that mean after BH adjustment across 53 H03-F4 site-deviation contrasts. Crosses at zero mark cells that failed the predeclared support rule; the melEDI axis transformation is display-only.
