

A

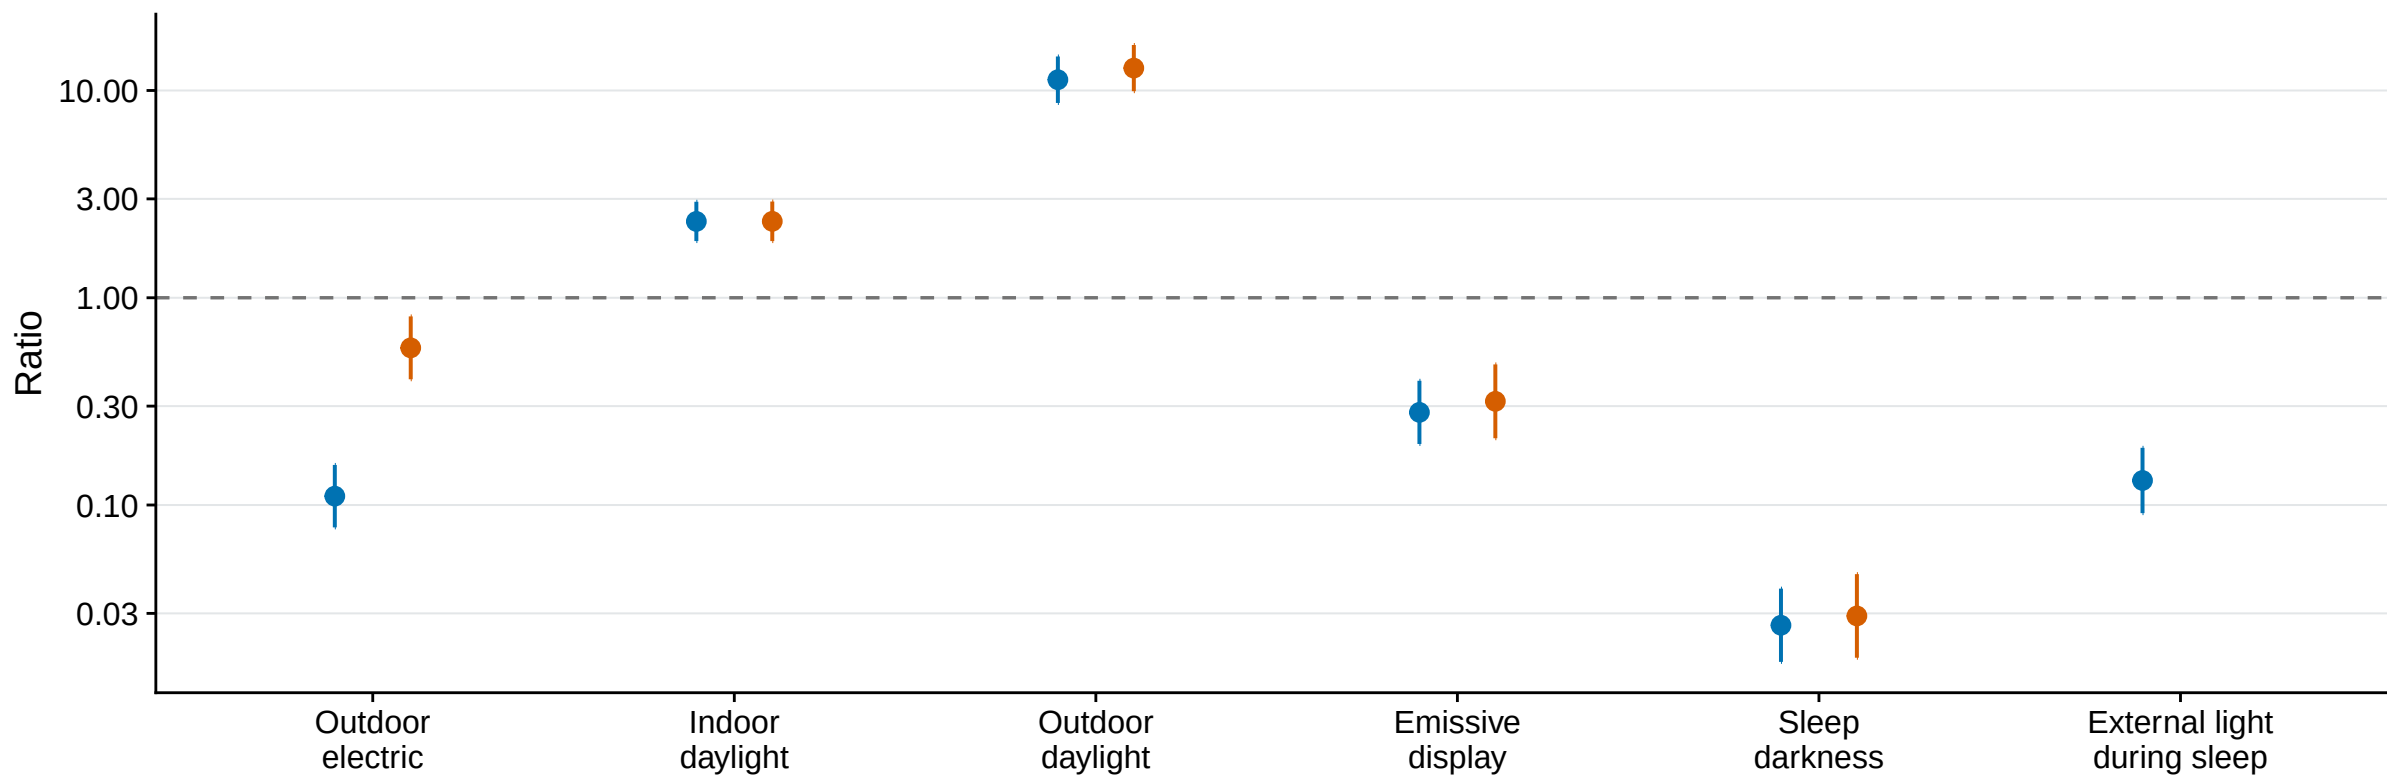

Site-standardized expected one-hour meEDI

Placement ● Near-eye ● Chest

B

Ratio to indoor electric light

Points and bars are estimates and participant-cluster-robust 95% confidence intervals.

Sites receive equal standardization weight; the meEDI axis transformation is display-only.

Estimates come from the selected category-by-site heterogeneity model.

The complementary chest external-light category cannot be standardized across all eight sites because one site-category cell is absent.
