

Bands are conditional pointwise 95% intervals; no simultaneous-band or curve-wide inferential claim is made. Site, participant, and participant-day smooths remain in the fitted model but are excluded from the displayed curves. Panel B divides each displayed category mean by the displayed global time-of-day mean; the dashed reference is 1. In panels A and B, filled circles mark observed support; open circles mark nonzero but locally sparse support (<20 participant-hours, <5 participants, or <3 sites at that category-hour). Grey regions and × mark zero observations. The melEDI axis transformation is display-only. Exploratory fixed-power Tweedie mean GAM ($p = 1.539919$; log link).
