

Site-specific activity-associated meEDI with observed support

Dashed line: equal-site category mean; filled points: BH-adjusted site deviation  $p < 0.050$

Estimates and dashed site-average values come from the five-category activity-by-site interaction model; Other is excluded.  
The dashed line is the geometric mean of site-cell expectations with every site weighted equally on the fitted log scale.  
Filled points pass the complete placement-specific BH adjustment; open points are other supported estimates; crosses are support non-estimable.
