

Paired near-eye and chest association estimates

Separate models use identical participant-days;
ratio outcomes use the natural-log ratio scale per one VLSQ-8 SD

Metric category ● duration-based ▲ exposure-history-based ■ level-based

Dashed line: identical estimates; grey lines: null; component bars: 95% Wald intervals. The identity-Gaussian pre-sleep metric remains in the paired source table because hours and log ratios must not share an axis.
