

H10 age structure and statistically supported associations

Near-eye evidence is primary and chest evidence complementary; placements are not pooled

A

Participant age distribution in each fitted placement sample

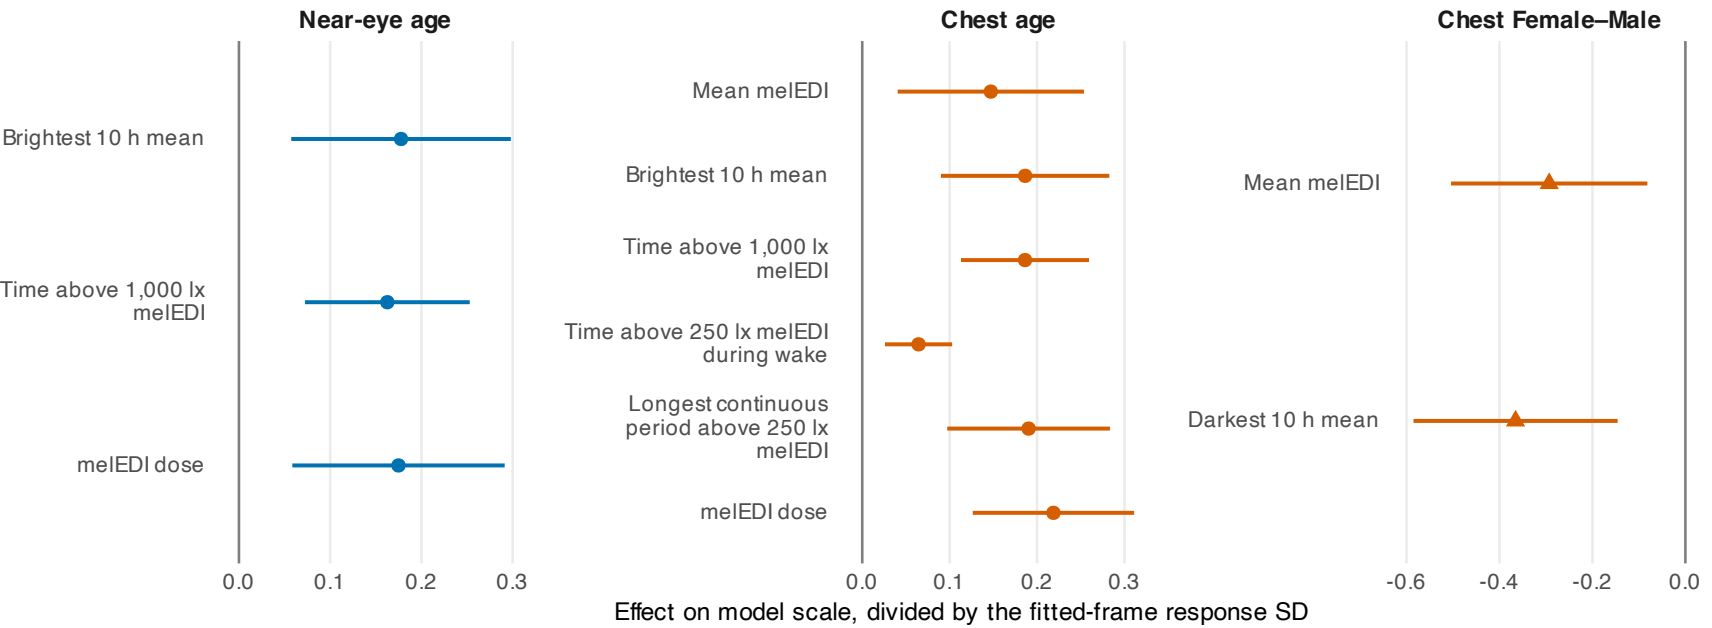

One point per participant; sites follow site display order and colours (near eye n = 141; chest n = 154)

B

All main associations retained after multiplicity correction

Points and bars are standardized fitted-frame effects and 95% confidence intervals; all 11 shown estimates meet their separate 17-metric BH rule

C

Site-specific age estimates for the two retained heterogeneity results

Chest placement; site-specific estimates are descriptive components of the two omnibus age-by-site comparisons, not separate site-level tests
