

Activity-context sensitivity of the Female-to-Male curve

Same sample within each placement: near eye, 126 participants and 30,499 observations;
chest, 150 participants and 36,711.

Ribbons are participant-cluster-robust pointwise 95% confidence intervals for each fitted curve, not an interval for the change between models and not simultaneous over time. The ratio axis is logarithmic around the null ratio of 1.
