

A Sex-specific chest curves in the gap-timing-unaware dataset

Equal-site conditional means; 154 participants, 894 participant-days, 41,664
30-minute observations

B Female-to-Male shifted-value ratio

All 48 displayed pointwise intervals exclude 1; circles are omitted to keep the curve readable. Intervals are not simultaneous.

Grey shading spans midnight to equal-site mean civil dawn and equal-site mean civil dusk to midnight. Intervals are pointwise, not simultaneous; the global participant-cluster-robust curve test is the inferential test and the display cannot establish a familywise-significant time period. The melEDI axis uses the specified symlog scale: linear from 0 to 1 lx and base-10 above 1 lx.
