Mean timing of exposure above 250 lx melEDI Average bright-light timing; summarizes the phase of daily circadian stimulation. Median (25th percentile, 75th percentile), *circular or arithmetic mean ± standard deviation*, N=participants; d=participant-days with a finite value for that metric.

¹ The brief meaning and relevance notes describe established physiological constructs; this descriptive table does not estimate individual health effects.

² Scaling describes the distribution column only; printed values remain on their stated scale. Symlog uses base 10 with a linear region through 1 in the stated unit; Identity is linear; Circular clock unwraps values around the metric-specific clock centre.

³ Red lines indicate site medians. Symlog and circular-clock rows are transformed only for plotting.

Supplementary Table S2. Definitions, exact support, median (interquartile range) summaries, and density displays for the 17 near-eye personal light-exposure metrics overall and by site. Values use three decimal places where applicable. Metrics are distinct summaries and should not be interpreted as interchangeable outcomes.
