

**Table S9. Participant-hour routine associations**

| Predictor                          | Ratio (95% CI)     | FDR-adjusted p   |
|------------------------------------|--------------------|------------------|
| Free day versus work day           | 1.45 × (1.14–1.85) | <b>0.004</b>     |
| Active versus sedentary            | 2.06 × (1.54–2.76) | <b>&lt;0.001</b> |
| Previous sleep duration (per hour) | 0.98 × (0.85–1.12) | 0.745            |

Directions are free versus work day, active versus sedentary day status, and the ratio per one additional hour of previous sleep. Participant-cluster-robust 95% CIs use HC3 with 137 participants. The three p-values form one FDR-adjusted family; the null ratio is 1.

**Supplementary Table S9.** Common-association estimates from the participant-hour analysis of Free versus Work day, Active versus Sedentary daily activity status and each additional hour of previous-night sleep duration. Ratios and participant-cluster-robust 95% confidence intervals come from the fixed-site model; the three *p* values form one FDR-adjusted family. Predictor-by-site differences are shown in Supplementary Figure S12.
